

VISLINK-WARE

A CryptoMetrics® SecurIDent™ Product

VisLink-ware takes the images generated from the VisPro-ware SDK and communicates to the VisMatch-ware Face Matching software on the server side.

Customers use this product to configure their client software to communicate over an HTTP based networking transaction.

This product provides the option of having a number of decentralized face capture cameras and Face Processing software operating in the field away from a central server that contains the face matching database.

Features:

- Vendor-agnostic design enables it to work with most face-recognition software packages
- Runs on systems operating in Microsoft® Windows® 2000 and XP environments

Benefits:

- HTTP-based communication makes deployment fast and easy
- Allows for one central image server to support multiple camera deployments in the field
- Minimizes costs by maximizing use of biometric image servers
